

Practical No.6

Aim: Creating a Keylogger with Python

- Write a Python script that captures and logs keystrokes from a target system.
- Execute the keylogger script and observe the logged keystrokes.
- Understand the potential security risks associated with keyloggers and the importance of protecting against them.

Code:

```
import logging
print("Bhumika Shelar | T114")
# Log file
log_dir = ""
logging.basicConfig(filename=log_dir + "typed_log.txt",
                    level=logging.DEBUG,
                    format='%(asctime)s: %(message)s')

def log_input():
    while True:
        text = input("Type something (or 'exit' to stop): ")
        if text.lower() == "exit":
            print("Logging stopped.")
            break
        logging.info(text)
        print("Logged:", text)

log_input()
```

```
import logging
print("Bhumika Shelar | T114")
# Log file
log_dir = ""
logging.basicConfig(filename=log_dir + "typed_log.txt",
                    level=logging.DEBUG,
                    format='%(asctime)s: %(message)s')
def log_input():
    while True:
        text = input("Type something (or 'exit' to stop): ")
        if text.lower() == "exit":
            print("Logging stopped.")
            break
        logging.info(text)
        print("Logged:", text)
log_input()
```
